**AUTOMATED PUMP
TECHNOLOGY**

Select's cutting-edge automated pumps are top-of-the-line in innovation and design. Through automation and artificial intelligence, our premium pumps can intelligently and safely oversee and control entire operations.

MITIGATE RISKS ASSOCIATED WITH MOVING PRODUCED WATER

We've engineered a superior automated pump designed with a sophisticated balance system. This computerized control enables pressure to run at different levels throughout the line, allowing the flow of water to increase without exceeding the pressure threshold, thus preventing a burst in the line.

This stability is feasible to maintain because the pumps are designed with multiple built-in pressure sensors that are placed throughout the entire line, including on the ends of each intake and discharge.

Achieve flow rate desired without creating a hazardous situation.

REDUCE UNFORESEEN SPILLS

Our automated pump technology detects leaks and malfunctions, prompting the pumps to automatically shut down operations. Select engineered the pumps with vacuum seal ends that activate once the valves are automatically closed. Once at a halt, the water remaining in the pipes will stay in place, preventing additional waste.

INNOVATIVE DESIGN

AUTOMATED PUMPS

Unlike basic or remote-controlled pumps, Select's automated pumps operate and monitor entire lines with minimal oversight. Our advanced technology detects leaks as well as malfunctions, takes action, and alerts operators.

MULTIPLE PRESSURE SENSORS

The pumps have built-in multiple pressure sensors that are placed throughout the entire line to maintain safe pressure and flow rates.

VALVES WITH VACUUM SEALS

Select's automated pumps hold water in place with featured vacuum seal back ends that are activated when operations are shut down.

BENEFITS

SPILL PREVENTION

Balance system regulates and maintains water pressure to prevent a burst in the line.

IMPROVE EFFICIENCY

Automated pumps work faster and longer with minimal oversight by operators.

REDUCE ERRORS

Increase reliability with specialized sensors.

INCREASE SAFETY

Only requires two operators manning from a designated command trailer. Fewer man hours per job means reduced risk.

MANAGE INFORMATION

Data analytics allow the system to predict accidents, detect malfunctions, and report maintenance issues.
